

# What's New at MagView

## ► Patient Results Web Portal

MagView's new Patient Results Portal offers an MQSA and HIPAA-compliant electronic alternative to printing and mailing letters to your patients. Patients who choose to receive their letters electronically receive an email with a link to your organization's website. The patient authenticates herself and enters the portal to receive her notification and recall letters. The portal automatically documents when the patient logs-in to receive her results, and sends a hard copy of the letter to any patient who fails to access her results.

To calculate your savings, count the number of notification and recall letters you are printing per exam. Multiply that by 42¢ postage per letter, plus your costs of letterhead, paper, envelopes and staff time of folding and stuffing envelopes.

## ► Results Extraction Interface

MagView's result extraction interface reduces the need to manually track breast exams dictated outside of MagView. The extraction interface works with any HL-7 capable dictation system, and scans the text of the result for the BI-RADS statement. MagView captures the required tracking information automatically, to ensure all MQSA statistics are accurate and all patient letters are sent.

The result extraction interface gives your radiologists the flexibility to generate results with MagView or pick up a mic and still maintain all MQSA data/letters.

## ► PreView™ Pre-Fetch Engine

MagView's PreView™ pre-fetch engine eliminates the need to manually request priors by auto-fetching images ahead of time based on your schedule. PreView can also query a DICOM worklist or receive orders in real-time as patients are checked-in, to reduce delays and ensure prior images are available when your radiologists are ready to read.

MagView's suite of solutions for healthcare management are designed to grow with your practice, and can be added to your system at any time:

- Patient History Module for self-check-in on a Tablet PC
- Softcopy review station synchronization interface
- DICOM "brokerless" worklist provider and query engine
- AutoFax server software
- SmartScheduler™ resource-driven scheduling software, with automated one-click appointment search and multi-view calendar booking
- Document scanning with unlimited document types and pathology reports
- Built-in voice recognition based on Dragon NaturallySpeaking
